US-09-566-922A-19

i Sequence 19, Application US/09566922A

i GENERAL INFORMATION:

APPLICANT: The Board of Regents of the University of Nebraska

TITLE OF INVENTION: COMPOSITIONS AND METHODS FOR ENHANCING IMMUNE RESPONSES MEDIATED

TITLE OF INVENTION: ANTIGEN-PRESENTING CELLS

TITLE OF INVENTION: ANTIGEN-PRESENTING CELLS

CURRENT APPLICATION NUMBER: US/09/566,922A

CURRENT PILING DATE: 1998-04-17

PRIOR PILING DATE: 1998-04-17

PRIOR APPLICATION NUMBER: US 60/005,727

PRIOR PILING DATE: 1955-10-18

PRIOR PILING DATE: 1955-10-20

NUMBER OF SEQ.ID NOS: 19

SOFTWARE: Patentin version 3.0

SERVERAL INFORMATION:

APPLICANT: Gorman, Cornelia M.

APPLICANT: Groskreutz, Debyra J.

TITLE OF INVENTION: FROHORMONE CONVERTASE TRANSFORMED CELLS AND POLYPEPTIDE SYNTHESIS

TITLE REFERENCE: 11669-103108W3

CURRENT APPLICATION NUMBER: US/09/997,868A

CURRENT APPLICATION NUMBER: US 00/26,143

PRIOR PILING DATE: 1993-03-01

PRIOR FILING DATE: 1993-12-04

PRIOR FILING DATE: 1992-12-06

PRIOR APPLICATION NUMBER: US 07/803,631

PRIOR PILING DATE: 1991-12-06

NUMBER OF SEQ ID NOS: 61

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A, dene: GDB:PI
A, Gene: GDB:PI
A, Introns: 216/1; 306/2; 355/3
A, Note: it also inhibits plasmin, thrombin, kallikrein, trypsin, and chymotrypsin
C; Buperfamily: Serpin

Biochem. J. 307, 369-375, 1995
A;Title: Rabbit alpha-1-antiproteinase E: a novel recombinant serpin which does not inhit A; Reference number: S54981; WUD: 95251597; PMID: 7733871
A; Rocession: S54981
A; Rocession: S54981
A; Rocession: S54981
A; Rocession: S72199
A; Rolecule type: mRNA
A; Residues: 1-413 < SAI1>
A; Rocession: S72199
A; Rolecule type: protein
A; Residues: 25-33;374-387 < SAI2>
C; Superfamily: Serpin
C; Keywords: acute phase; emphysema; glycoprotein; plasma; serine proteinase inhibitor
F; 1-24/Domain: signal sequence #status predicted <SIG>F; 25-413/Product: alpha-1-antiproteinase E #status experimental <WAT>

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  "Portine alpha-1-antitrypsin (PI): cDNA sequence, polymorphism and assignment to chromosome 7q2.4-q2.6."; Anim. Genet. 27.85-89(1996).
-!- FUNCTION: Inhibitor of serine proteases. Its primary target is elastase, but it also has a moderate affinity for plasmin and thrombin (By similarity).
-!- SUBCELLULAR LOCATION: Extracellular.
-!- SIMILARITY: Belongs to the serpin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Archibald A.L., Couperwhite S., Mellink C.H.M., Lahbib-Mansais Y.,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sus scrofa (Pig).

-!- FUNCTION: Inhibits human leukocyte elastase, pig pancreatic elastase and bovine trypsin on a 1:1 molar basis.
-!- SUBCELLULAR LOCATION: Extracellular.
-!- TISSUE SPECIFICITY: Plasma.
-!- SIMILARITY: Belongs to the serpin family.

The present sequence is alpha-1 antitrypsin mutated variant Portland (also termed PDX). This effectively inhibits furin endoprotease. Peptides or peptide mimetics derived from this sequence inhibit bacterial toxins that are processed at a consenus furin recognition site, when administered in therapeutically effective amounts. Portland protein designing the PISPL program and the crystal structure analysed for designing the pharmacophore for the reactive site loop of the Portland variant. Endoproteolytic activation of bacterial toxins and endolytic mimetics. This is useful in treating infections of cells by bacteria (specifically Corynebacterium diptheriae, Bacillus anthracis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Alpha-1 antitrypsin variant Portland; alpha-1 antitrypsin; PDX; protease inhibitor; furin endoprotease; peptide mimetic; bacterial toxin; furin recognition site; portland protein; SYBYL program; pharmacophore; protein crystal structure analysis; reactive site loop; RSL; endolytic maturation; endoprotelytic activation; Pseudomonas aeruginosa; Corynebacterium diptheriae; Bacillus anthracis; cytomegalovirus;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New furin endoprotease inhibitor that mimics a specific region of alphalantirypsin Portland mutant, for treatment and prevention of bacterial and viral infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Pseudomonas aeruginosa) or viruses (specifically cytomegalovirus). It may also be used to inhibit processing of biologically active proteins

inhibition assay to assess the biological activity of the peptide mimetics. A7 cells when incubated with PIT exhibited little or no protective effect in the presence of Pseudomonas aeruginosa exotoxin A. PIT was also used as a negative control for the assay to detect PDX - mediated inhibition of furin-catalysed maturation of HCMV glycoprotein gB

The present sequence represents the mature protein of alphal-antitrypsin (AAT). The protein is used to exemplify the invention. The specification of describes a method for producing mature heterologous protein in monocotyledomous plant cells. The method comprises transforming the cells with a chimeric gene comprising a monocotyledom transcription regulator, inducible either during seed maturation or by adding/removing a small colecule, DNA encoding the heterologous protein, and DNA encoding a signal peptide, with the signal peptide causing secretion of the protein completed, with the signal peptide causing secretion of the protein completed, with the signal peptide causing secretion of the protein completed alpha 1-antitrypsin (ART) with a glycosylation pattern that significantly increases its serum half-life, mature glycosylated antithrombin III (ATII), mature human serum albumin (HSA) having the native folding pattern as shown by bilirubin-binding characteristics, or mature active subtilisin BPN. These proteins are useful therapeutically control of the promoter active subtilisin BPN. These proteins are useful therapeutically control of the promoter active subtilisin BPN. These proteins are useful therapeutically control of the protein control of the protein control of the c

Novel fusion protein useful for inhibiting protease activity associated with a disorder such as emphysema, asthma, comprises a first protease inhibitor comprising alpha 1-antitrypsin and a second protease inhibitor.

Claim 25; Page 25-27; 134pp; English.

protease inhibitor comprising an alternative control to protease inhibitor or its functionally active portion and a second protease inhibitor or its functionally active proteins and a second protease inhibitor or its functionally active protease activity. The fusion protein of the invention may act as an inhibitor of protease activity. The fusion protein of the invention is useful for inhibiting protease activity associated with a disorder such as complysemma, askimma, chronic obstructive pulmonary diseases, cystic fibrosis, oitis madia, otitis external or HIV infection, or for treating an individual suffering from or at risk for a disease or disorder convolung unwanted protease activity. The proteins are useful for treating dermatological diseases such as atopic dermatitis, eczema and parating dermatological diseases such as atopic dermatitis, eczema and convolung in inflammatory responses to viral infection, and for treating wounds, sepsis, rheumatoid arthritis, periodontal disease, tumour metastasis and tumour anglogenesis, gastric ulceration, osteoporosis, paget's disease, glomerulonephritis, gastric ulceration, advanced infection, alzheimer's disease, hypertension and muscular dystrophy. The present sequence represents the human alpha-1-antitrypsin (AAT) protein cuest to create the fusion protein of the invention This invention relates to a novel fusion protein comprising a first

Halle J, Goppelt A;

WPI; 2004-341870/32. N-PSDB; ADM82879. Use of alpha 1-antichymotrypsin polypeptide in combination with alpha 1-antitrypsin polypeptide for treating and/or preventing poorly healing diabetes-associated and/or poorly healing arterial wounds e.g., diabetic

Claim 2; SEQ ID NO 4; 31pp; English.

The present invention describes a method of using alpha 1antichymotrypsin (ACT), its functional variant and/or encoding nucleic
antichymotrypsin (ACT), its functional variant and/or encoding nucleic
acid, in combination with alpha 1-antitrypspin (AAT), its functional
caid, in combination with alpha 1-antitrypspin (AAT), its functional
caid, in combination with alpha 1-antitrypspin (AAT), its functional
correction or its encoding nucleic acid, for treating and/or preventing
copypeptide or its encoding nucleic acid, for treating and/or preventing the diseases, where the ACT polypeptide or its encoding
cucleic acid or a cell expressing the AAT polypeptide or its encoding
cucleic acid or a cell expressing the AAT polypeptide or its encoding
cucleic acid is combined with the AAT polypeptide or its encoding nucleic
acid or a cell expressing the AAT polypeptide or its encoding
cucleic acid is combined with the AAT polypeptide or its encoding
cucleic acid as cabined with the AAT polypeptide or its encoding
cucle acid or a cell expressing the AAT polypeptide or its encoding
cucleic acid is combination) are useful for treating and/or
cacid or a cell expressing the AAT polypeptide or its encoding
cucleic acid as diabetes associated and/or poorly healing
cuterial wounds such as diabetic ulcer and arterial ulcer, preferably
clabetic ulcer. Diabetic ulcers are skin lesions in mammals and humans
cuffering from diabetes (e.g., include ulcus cruris arteriosum,
caused by arteriosclerotic destruction of the blood vessels. The present
cevemplification of the present invention.

Predominant form of human alpha-1-antitrypsin as encoded by cDNA.

Human alpha-1-trypsin (hAT); anti-AT antibodies; proteolytic activity; AT deficiency; Saccharomyces cerevisiae GK 100; 2-mu plasmid DNA; CATI; plasmid HAT4; yeast TPI promoter; yeast TPI terminator; plasmid C1/1.

produce of a mammalian alpha-lance of AT). Also claimed is the produce of a mammalian alpha-lance of AT). Also claimed is the produ. of polypeptides having the protease-inhibiting activity of a mammalian AT. A culture of microorganisms is grown such as fungi or yeast, esp. Saccharomyces cerevisiae GK 100, which are transformed with a DNA transfer vector 2-mu plasmid, plasmid CATI or plasmid HAT4, contg. a segment encoding the mammallan AT. The unglycosylated polypeptides are useful for produ. of anti-AT antibodies, for modulating proteolytic activity in mammals, and for treating AT deficiency, esp. for replacing TAT4, the diven example plasmid HAT4 comprises the yeast promoter, an ATGGAGGATC adapter, the hAT gene and the yeast promoter, an ATGGAGGATC adapter, the hAT gene and the yeast promoter, an argine of 101, which contains the entire 2-mu DNA from S. cerevisiae. S. cerevisiae GK100 transformed with HAT4 produces soluble protein with an hAT content of 2-3* when grown on a medium contg. 6* glucose. (Updated on 25-MAR-2003 to correct PF field.) (Updated on 25-MAR-2003 to correct
                                                                                                                                                                                                                                                                                                                         in the patent are unglycosylated polypeptides having the amino acid
                                                                                                                                                                                                                    New alpha-1-antitrypsin polypeptide(s) - produced by recombinant DNA techniques, esp. using yeast host.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

This sequence represents the coding region of the human alpha-1-antitrypsin (AT) gene. The invention relates to the production of AT in plant cheells, especially monocovyledonous plants. Also produced are variants of the AT protein, in which the glycosylation pattern of the protein is altered. AT inhibits serine proteases, specifically neutrophil elastase (but also trypsin, cathepsin G, thrombin etc.) so protect pulmonary tissue against protease damage. Are used to treat AT-deficiency conditions, particularly pulmonary emphysema, cystic fibrosis, septic shock and rheumatism. The use of plants for the recombinant production of AT results in a product without risk of (sub)viral contamination. The recombinant AT had good activity and is stable, with low immunogenicity (associated with glycosylation patterns similar to the native protein)
                                                                                             Human; alpha-1-anti-trypsin; transgenic plant; monocotyledon; variant; glycosylation; serine protease; inhibitor; neutrophil; elastase; trypsin; cathepsin G; thrombin; pulmonary tissue; protease damage; septic shock; pulmonary emphysema; cystic fibrosis; rheumatism; recombinant;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        FAMLSLGTKADTHDEILEGLNFNIJQIPEAQIHEGFQELLRTLNQPDSQLQLTTGNGLFL 120
